INERTIA / OCTOBER 30 DEMO

The intended architecture

Organization-wide work, with funding as the first full workflow target. This is the approved direction; it is not a deployment-status diagram.

People + authorized sources

Current membership and action authority. Website, shares, meetings, Buzz and funding sources.

Member app + Paperclip

Partner owns the member app. Native goals, tasks, dependencies and review coordinate work.

Protected VPS boundary

Cloudflare Access + tunnel. Durable state and artifacts. No Caddy; one execution plane.

GENERAL COORDINATOR

Funding priorities + meetings + ordinary organization work; delegate, monitor, return useful results.

Alpha / discovery

Incremental and change-aware scanning, source high-water/checkpoint reuse, targeted discovery and full coverage accounting. Retain captures and explain failures.

Parallel Beta / cases

Each actionable opportunity: research, compile, draft and correct. Retain valid checkpoints; genuine human waits do not stop other cases.

Charlie / independent review

Separate principal reviews exact source/artifact versions. Rejection returns the same case for correction; source admission is not final packet approval.

P1 / reuse knowledge + careful Buzz

Existing member corpus is useful now. Funding machine-reader wiring and Paperclip real bridge are separate gaps. Signed admission, current audience, pairing and replay remain explicit.

P2 / Google push + human authority

Existing Gemini notes -> owning DAO import/readback -> deduplicated action triage. Review useful outputs; current submission is manual. Future agent submission requires separate exact-package authorization and qualification.

Snapshot: 29 Oct 2026, 16:01:56 CDT operator proof. Static document; refresh before presenting.

INERTIA / OCTOBER 30 DEMO

What is actually demonstrated

UI/API is restored in maintenance mode. Scheduler disabled, company paused, no executors. Normal funding execution and portfolio fanout remain unproved.

Member knowledge / working

Human confirmed /work answers organization questions from the stored corpus. Funding agents still lack a scoped machine reader. Source chips do not constitute immutable review receipts.

WORKING CAPABILITY / HUMAN CONFIRMED

Alpha -> Coordinator / handoff

13 source/case bindings with provenance reached the Coordinator. All 13 Beta child attempts hit native capacity. Reviewed source repair exists; Coordinator0 not applied.

PRODUCTION HANDOFF / FANOUT NOT PROVEN

Review -> correction / proven

Independent Charlie rejection automatically resumed the same case in Beta. Deployed large-source paging delivered36 pages; isolated1.2MB/182-page scale proof is separate.

RECORDED PRODUCTION + ISOLATED SCALE CHECK

Rendered brief / retained output

One ~1,179-word content revision, eight typed fields; Markdown and DOCX renders. Conditional pursuit/checklist brief, not an application narrative, project, budget or final packet.

UNREVIEWED BRIEF / NOT SUBMISSION READY

Source fix / deployment pending

Capacity19d plus startup reconciliation2d4900d passed isolated full-server boot with plugin READY, scheduler true and HTTP200. Newer completed review preserved; unreviewed DONE denied. Integrated archive being built.

SOURCE / ISOLATED PROOF, NOT LIVE RELEASE

What is still missing

Normal postboot and execution proof; real portfolio fanout; substantive accepted application materials; scoped corpus reader; Paperclip real Buzz bridge; actual notes import/intake. Human onboarding still requires actual completion.

NO FULL MISSION OR FINAL PACKET ACCEPTANCE

Snapshot: 29 Oct 2026, 16:01:56 CDT operator proof. Static document; refresh before presenting.

INERTIA / OCTOBER 30 DEMO

A useful five-minute walkthrough

Use existing artifacts and a harmless organization question. If a step is unavailable, show dated evidence; do not run repair commands during the demo.

1 / Purpose + architecture - 30 sec

Show the big-picture view. Explain the general Coordinator, native work, separate case owners and independent review.

2 / Existing knowledge - 60 sec

Ask the known DATACU-style question in /work. Show sources. State that funding machine-reader wiring is still missing.

3 / Discovery handoff - 60 sec

Open the retained13-binding Alpha -> Coordinator queue. Explain the capacity blocker; do not pretend case fanout succeeded.

4 / Critique and correction - 60 sec

Show the retained independent rejection and same-case Beta continuation. Rejection demonstrates quality control, not accepted application content.

5 / Actual generated output - 60 sec

Show the eight-field brief and available render. Call it a pursuit brief; narrative, project, budget and final packet remain unfinished.

6 / Next useful outcome - 30 sec

Normal execution, retained portfolio fanout and reviewed application material. Connect existing corpus/notes through owning interfaces.
